Opportunity Cost Distribution

1. Project Scope

This dashboard analyzes a selected universe of 30 Vietnamese listed stocks using quarterly market data.

The dashboard focuses on:

- Market and sector performance
- Stock signal classification
- Relative strength versus VN-Index and VN30
- Peer comparison and opportunity cost analysis

Universe: 30 VN30-style listed stocks

Frequency: Quarterly

Period: 2023Q1-2026Q3

2. Data Pipeline

Python + vnstock is used to fetch daily historical stock prices and convert them into structured quarterly datasets.

Pipeline workflow:

1. Fetch daily price data
2. Convert daily data into quarterly data
3. Calculate technical indicators
4. Build signal scores
5. Add benchmark and relative strength metrics
6. Generate peer comparison and opportunity cost tables
7. Load processed CSV files into Power BI

Python → CSV → Power BI

4. Opportunity Cost Logic

Opportunity cost is estimated by comparing a selected stock with its sector peers.

Score Gap = Peer Signal Score – Selected Stock Signal Score

Return Gap = Peer 3-Month Return – Selected Stock 3-Month Return

Interpretation:

- Positive Score Gap: peer has stronger signal quality.
- Positive Return Gap: peer outperformed the selected stock.
- Higher gaps indicate higher potential opportunity cost.

3. Signal Scoring Framework:

Signal Score Weighting

5. Limitations & Assumptions

Current limitations:

- Fundamental and valuation scores are placeholders in v1.1.
- The model mainly uses price, liquidity, volatility, and relative strength indicators.
- The dashboard does not include macro data, news sentiment, transaction costs, or forward-looking estimates.
- Signal outputs are designed for screening, not direct investment decisions.

Key assumption:

Higher signal scores indicate stronger screening quality, but they do not guarantee future returns.

7. Next Phase

Planned upgrades:

- Replace placeholder fundamental and valuation scores with financial ratio data.
- Add ROE, ROA, EPS growth, revenue growth, P/E, P/B, and profit growth
- Add sector rotation and market breadth indicators
- Build stock-level detail pages for deeper analysis

=> These metrics are used as screening overlays and are not yet fully integrated into the total signal score

6. Benchmark & Relative Strength

This version adds VN-Index and VN30 returns to evaluate whether each stock outperformed or underperformed the broader market

Relative Strength vs VN-Index = Stock Quarterly Return - VN-Index Quarterly Return

Relative Strength vs VN30 = Stock Quarterly Return - VN30 Quarterly Return

Interpretation:

- Positive relative strength: outperformed benchmark.
- Negative relative strength: underperformed benchmark.

Phase 2 Scoring Update

Total Signal Score includes Relative Strength Score:

- Technical Score: 25%
- Fundamental Score: 25%
- Valuation Score: 15%
- Liquidity Score: 15%
- Risk Score: 10%
- Relative Strength Score: 10%

Fundamental and valuation scores are placeholders in the current version and will be replaced with financial ratio data in the next phase.

Disclaimer: This dashboard is not investment advice. It is built for educational, analytical, and portfolio demonstration purposes only.
